Our other sources of inspiration

The banner features the SmartAPI logo, a stylized blue fish-like creature, set against a dark blue background with a white geometric network pattern. The text 'SmartAPI' is prominently displayed in white, with the tagline 'BUILDING A CONNECTED NETWORK OF FAIR APIS' below it. Navigation links 'Add an API', 'Registry', 'Editor', and 'Portals' are visible in the top right corner. At the bottom, there is a call to action 'New to SmartAPI?' with a 'START HERE' button and the text 'Follow this step-by-step guide to help you contribute to SmartAPI for the first time'. The footer text reads 'Towards Materials and Manufacturing Commons - the enablers Digital Marketplaces'.

Enhancing the Discoverability and Interoperability of Multi-disciplinary Semantic Repositories

Doron Goldfarb¹[0000-0003-1183-6041] and Yann Le Franc²[0000-0003-4631-418X]

Abstract. The aggregation of multi-disciplinary information is a challenge faced by large-scale data infrastructures serving scientific domains such as biodiversity, agronomy or ecology. This requires the integration of ontologies or thesauri from different domains. These semantic resources are often hosted within domain specific repositories which can be harvested for that purpose. The lack of discoverability, the technical and metadata heterogeneity of the semantic repositories pose a challenge for their effective integration. In this context, we argue that there is a need for a semantic lookup-service to access and use this heterogeneous landscape. We then present a proof-of-concept design and implementation for harvesting different ontology repositories (BioPortal, AgroPortal and EBI-OLS). We show some preliminary analytics and discuss technical issues regarding aggregation. Finally, we conclude with an open call for collaboration to address the issues hampering such initiatives.

Keywords: Ontology libraries, Semantic annotation, Ontology lookup service, EUDAT.

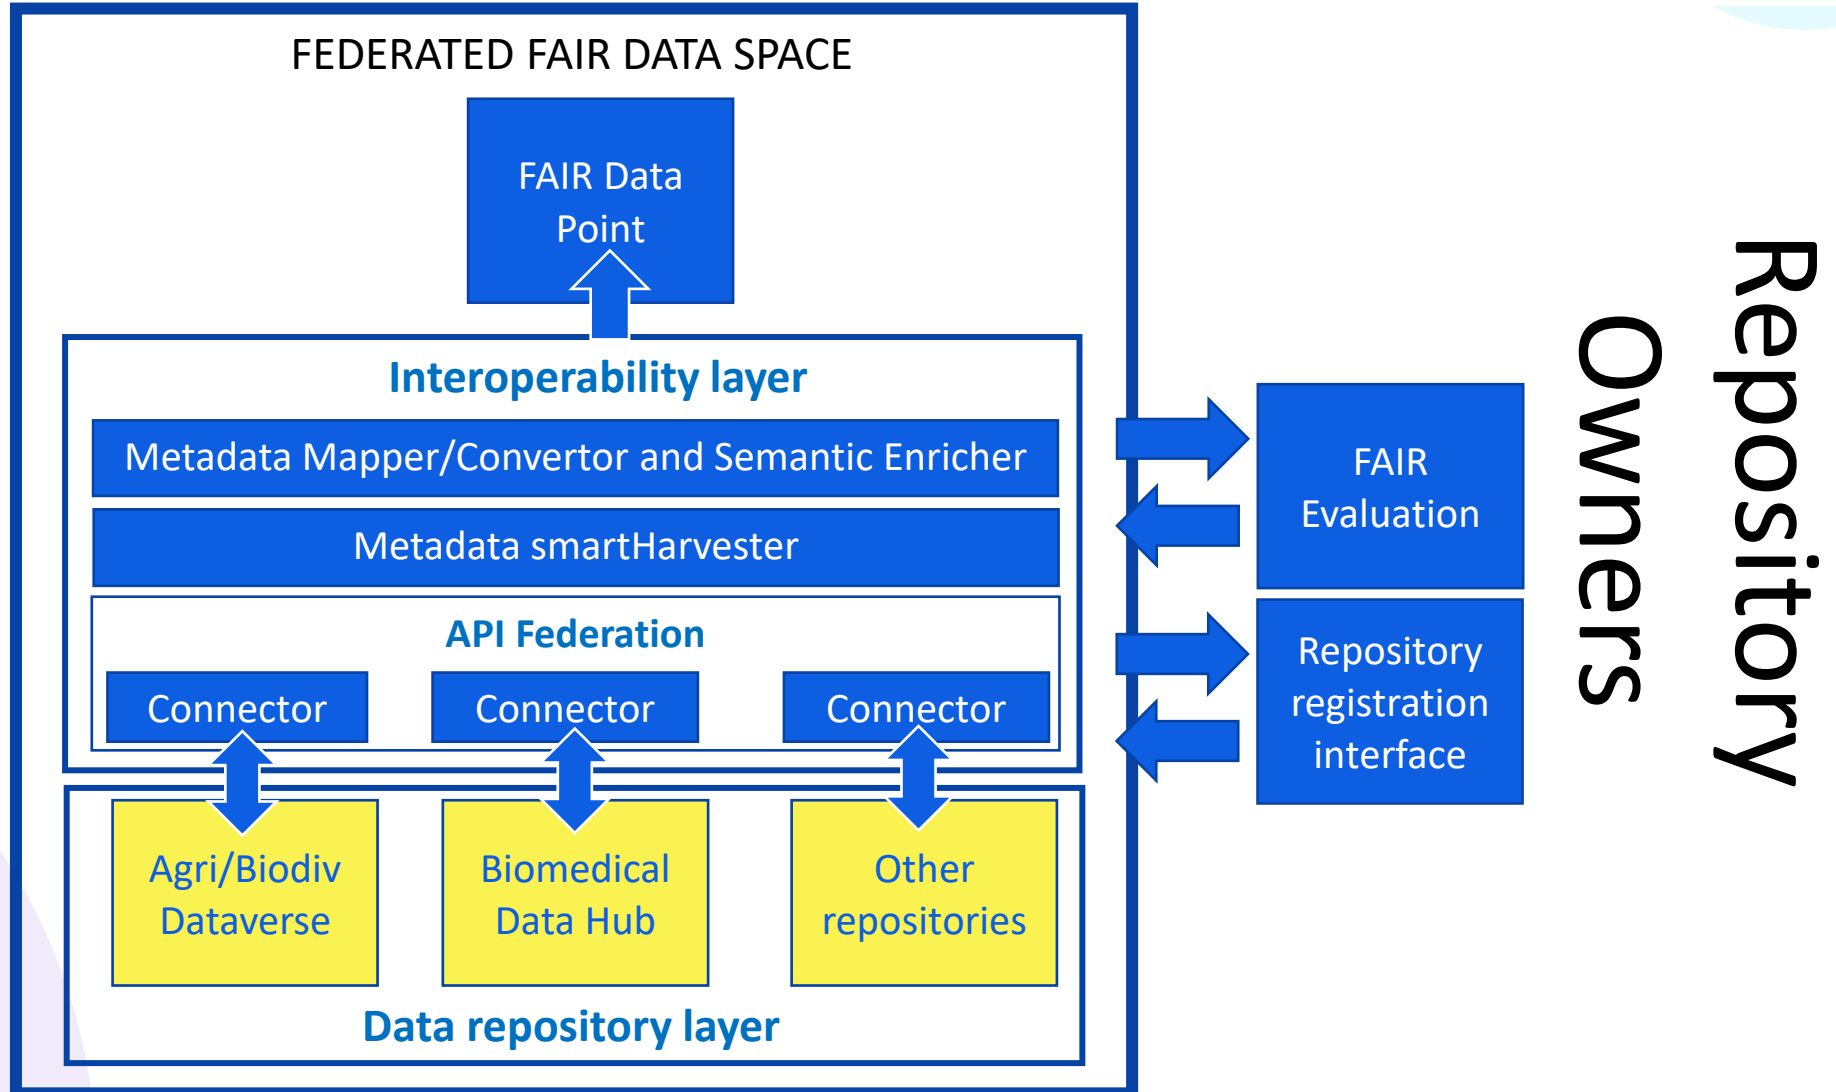

1 Introduction

Semantic technologies are increasingly used by domain-specific Research Infrastructures (RIs) and large-scale multi-disciplinary infrastructures such as EUDAT¹. Semantically-enabled services offer a framework to aggregate data from multiple sources, enhancing discoverability and interoperability. The EUDAT pilot service B2Note² is one such service, allowing the creation of semantic annotations of datasets within and outside of the EUDAT infrastructure. The process of annotation is about “attach[ing] data to some other piece of data” [1]. In the scope of the Semantic Web, this usually refers to the contextualisation of information within a wider knowledge graph in order to support discovery and, eventually, automated reasoning. Such a

A minimum metadata schema for FAIR Semantic Artefacts

Workshop jointly organised with RDA VSSIG: community driven minimal metadata model and DCAT profile for Semantic Artefact

- 76 participants from 17 different communities
- Define a common model for publishing Semantic Artefacts based on DCAT
- Define a minimum set of descriptive metadata for FAIR Semantic Artefact using MOD (Dutta et al., 2015; Dutta et al., 2017)

⇒ Initial DCAT profile using standards metadata properties and enriched with 12 properties from MOD

⇒ Profile formalisation (OWL/SHACL)
